Summary of Changes

This publications reflects additions and corrections of product information throughout. It incorporates content from previous technical data publications (140G-TD100 and 140G-TD047), and contains new information for current-limiting molded case circuit breakers.

Additional Resources

These documents contain additional information concerning related products from Rockwell Automation.

Resource	Description
Circuit Breaker Protection for Automation Systems, publication 140G-BR001	Overview of full line of Allen-Bradley circuit breaker offerings.
Circuit Breaker Selectivity Guide, publication 140G-TD050	Aids in selecting circuit breaker pairs for line and load side protection.
Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1	Provides general guidelines for installing a Rockwell Automation industrial system.
Product Certifications website, http://www.rockwellautomation.com/global/certification/overview.page	Provides declarations of conformity, certificates, and other certification details.

What is a Circuit Breaker?

What is a circuit breaker? This is the first question to answer in understanding Molded Case Circuit Breakers. The definition of a circuit breaker varies between the standards organizations, but the most commonly used definitions are:

The National Electrical Manufacturers Association (NEMA) defines circuit breakers as “devices designed to open and close a circuit by non-automatic means, and to open the circuit automatically on a predetermined overcurrent without injury to itself when properly applied within its rating.”

The International Electrotechnical Commission (IEC) Standard IEC 60947-2 defines a circuit breaker as “a mechanical switching device, capable of making, carrying and breaking currents under normal circuit conditions and also making, carrying for a specified time and breaking currents under specified abnormal circuit conditions such as those of short-circuit.”

There are also similar definitions, that further identify circuit breakers by type of construction and functionality. Within the IEC specification for circuit breakers, there are several distinctions of types of circuit breakers by classification:

Utilization Category

Interrupting medium

- Air break
- Vacuum break
- Gas break

Design

- Open case
- Moulded (molded) case

Method of controlling the operating mechanism

- Dependent manual operation
- Independent manual operation
- Dependent power operation
- Independent power operation
- Stored energy operation

Type of overcurrent release

- Instantaneous
- Definite time delay
- Inverse time delay

In reviewing the attributes just listed, it is understandable that many people are confused about which type of circuit breaker to use, where to use it, and how to select it properly. In this section, we will focus on the definition, application and selection of Molded Case Circuit Breakers (MCCBs) with an inverse time delay as applied to industrial control panels.

This publication focuses on the application and selection of MCCBs, Motor Protection Circuit Breakers (MPCBs) and Motor Circuit Protectors (MCPs). The primary focus will be on products that are packaged in a molded case design, but much of the information can be applied to other circuit breakers that are commonly found in control panels.

Definitions

Each of the product categories we mentioned earlier is packaged in a molded case and confusion develops because of the physical similarity of the products.

The Molded Case Circuit Breaker is a specific type of circuit breaker. NEMA defines circuit breakers as devices designed to open or close a circuit by nonautomatic means, and to open the circuit automatically on a predetermined overcurrent without damage to itself when properly applied within its rating. The term “molded case” simply refers to the construction of the circuit breaker and refers to the fact that the circuit breaker is an assembled unit in a supporting housing of an insulating material.

Within the realm of MCCBs, three distinct product variations exist, each with specific protection properties and uses within the industrial control panel. The main categories are:

Molded Case Circuit Breakers or Feeder Breakers

MCCBs are intended to provide overcurrent protection for conductors and equipment by opening automatically before the current reaches a value and duration that will cause an excessive or dangerous temperature in conductors or conductor insulation. Additionally, these devices can serve as the main disconnecting means for a control panel. This protection pertains to low level overcurrent, and short-circuit current. Traditionally these types of circuit breakers are generically described as thermal magnetic devices, though an increasing number of these devices are also electronic circuit breakers which provide the same type of protection, with the exception that the electronics allow the protection curves to be customized to the specific application. In the United States, the National Electrical Code (NEC) defines how

this protection is selected in Sections 240-2, 240-3 and 240-4. In Canada there are similar references in the Canadian Electric Code, C22.1-12. For IEC applications, IEC 60204-1 provides guidance for the construction of industrial control panels.

Motor Protection Circuit Breakers

As application-specific variations of the MCCB, motor protection circuit breakers (MPCBs) combine the short-circuit and isolation functionality of the MCCB with the motor overcurrent protection of a traditional overload relay. These devices are traditionally used in two-component starter applications, with a contactor to control a motor load. MPCBs are UL 489 Listed as circuit breakers and verified as motor overload relays. Allen-Bradley MPCBs are UL Listed as 100% breakers, allowing utilization of the full range of motor protection provided. Note: most circuit breakers applied in North America are 80% rated, meaning they can only be used continuously at 80% of their thermal rating. Allen-Bradley MPCBs are 100% rated, which allows full use of the circuit breakers' thermal capacity in motor protection applications.

Motor Circuit Protectors

Another application-specific version of the MCCB, the motor circuit protector (MCP) is a magnetic trip only version of the MCCB. These circuit breakers provide no overload protection and, as a result, when applied in motor circuit need to be applied with a controller in order to provide short-circuit and overcurrent protection. In the United States, the MCP is UL Listed with a controller and together they form a combination starter. The advantage of this combination is the choice in overload protection that can be applied to the starter. Listed combinations can include thermal as well as electronic overload relays, providing users with protection that is customized for their application. The MCP can also be

provided in several variations, including high magnetic trip versions that allow them to be used with high-efficiency motors, reducing the chance of nuisance tripping due to the characteristic high inrush currents associated with these motors.

Where are each of these breakers used? [Figure 1](#) represents a typical multi-starter control panel. Note that the main disconnecting means is an MCCB, which is acting as both the main disconnect and feeder protection. There are several branches within this control panel. Both MCPs and MPCBs are being used to provide the branch a circuit breaker as a device in the case of the MCP, and branch short-circuit protection as well as overload protection in the case of the MPCB.

Molded Case Switch

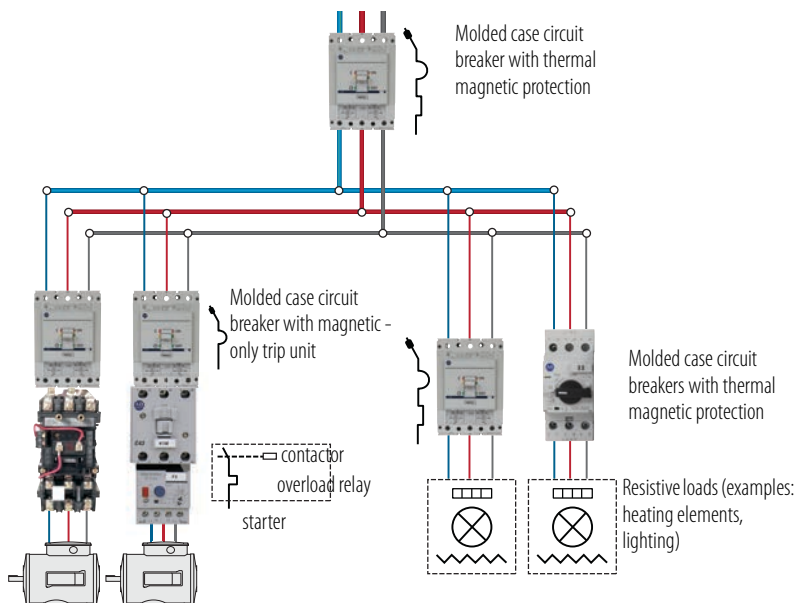

The function of a Molded Case Switch is to disconnect the downstream circuit in which it is installed. In the OFF position, the switch ensures sufficient electrical isolation to the circuit. Its mechanical function is the same as that of a circuit breaker with both an ON and OFF feature controlled with a toggle switch. It features the same overall dimensions and can accept the same electrical and mechanical accessories as an MCCB.

Typical applications include the following:

- Local isolation at a motor installation
- Disconnect to isolate a single/group of machines
- Bus-tie isolation

Molded case switches are not designed to automatically break under short circuit or overload conditions. For this reason, you must protect the line side with a coordinated device that protects against short circuits.

Figure 1 - Typical Multi-starter Control Panel

Breaker Theory and Construction

When used in an industrial control panel application, the purpose of the MCCB is to provide overcurrent protection.

This definition can be divided into short-circuit protection and thermal overcurrent protection. A short circuit can range from hundreds of amps to over 100,000 A, depending upon the power source and where the short circuit would occur in the circuit.

An arc chamber is integral to all MCCBs. This arc chamber is similar in all forms of the circuit breakers and performs several

important functions in providing short-circuit protection. This chamber surrounds the switching contacts within the circuit breaker and the contacts open during a short circuit. The opening of these contacts generates an arc. The arc chamber and its components, the arc chutes and splitter plates, draw the arc away from the contacts, dividing and cooling the arc. Ultimately, this leads to the extinguishing of the arc and the circuit opening and current flow stopping. One of the remarkable elements is that this entire operation occurs in milliseconds, with short-circuit currents that can be 100,000 A or greater, depending upon the available current in the circuit.

Figure 2 - Conventional Contact Design Compared to Reverse Loop Contact Design.

Depending upon the design of the circuit breaker and intended short-circuit interruption capability, there are differences in the construction of the contact assemblies. [Figure 2](#) shows the most commonly used contact assemblies

Modern circuit breakers use the reverse loop design because it uses the magnetic forces created by current flowing in opposite direction to assist in the opening of the contacts under short-circuit conditions. Additionally, the amount of repulsive force generated is proportional to the value of the short-circuit current being experienced by the circuit breaker. This allows faster interruption time as the short-circuit currents increase.

Using these magnetic trip units, we are able to provide short-circuit protection that can be represented in a curve as shown in [Figure 3](#).

Figure 3 - Example of Magnetic Time vs. Current Curve

This document is not designed to be a reference to circuit breaker design. However, we are discussing the construction of the arc chamber because it is important to understand that MCCBs with a 25 kA interrupting rating will require fewer arc splitters and smaller arc chutes to interrupt a short circuit than will a comparable device rated for 100 kA of interruption.

Therefore, when selecting an MCCB for a specific application, it is very important to take into consideration the amount of

short-circuit current available and then select the circuit breaker with an interrupting rating sufficient to meet the requirements of the application.

The MCCB also provides thermal protection for the control panel and, as we will see later, the branch circuit. This thermal protection can be provided either through the use of bimetallic heater elements similar to those found in overload relays or through the use of electronics, which simulate the operation of heater element and can provide adjustable overcurrent protection for the application.

Reverse-Fed Circuit Breaker

Due to physical equipment arrangements in panelboards, switchboards, and industrial control panels, it is often desirable to reverse feed a molded case circuit breaker. For this application, the circuit breaker must be tested and listed accordingly.

All Bulletin 140G circuit breakers may be reverse fed. When reverse feeding these devices, the line and load side terminals need to be identified properly.

Figure 4 - Reverse Feed Configuration

R	600	690

(1) NEC Article 404.7 states "Where these switch or circuit breaker handles are operated vertically rather than rotationally or horizontally, the up position of the handle shall be the (on) position." Refer to applicable codes and standards for specific application requirements

Interrupting Ratings

The maximum amount of fault current supplied by a system can be calculated at any point in that system. One rule must be followed for applying the correct circuit breaker. The interrupting rating of the breaker must be equal to or greater than the amount of fault current that can be delivered at that point in the system where the breaker is applied. The interrupting rating of the breaker is the maximum amount of fault current it can safely interrupt without damaging itself. A breaker's interrupting rating always decreases as the voltage increases. Interrupting rating is one of the most critical factors in the breaker selection process. Figure 5 shows a closeup of this rating information.

Figure 5 - Interrupting Rating Nameplate Information

Neutral Pole Ratings

When applying 4 pole MCCBs, the neutral pole is rated at 100% for thermal magnetics, and adjustable 100%, 50% or 0% for electronics.

Figure 6 - Neutral Pole Configuration

For all 4 pole 140G MCCB and Molded Case Switches, the neutral is the left outside pole

Certifications

To provide customers with third-party assurance that Rockwell Automation MCCBs meet industry standards, our circuit breakers comply with various global standards. The Bulletin 140G MCCB and 140MG MCP and MPCBs comply with UL, CSA and IEC standards and as such, are UL Listed, CSA Certified, and CCC Certified.

Other certifications exist for the family of MCCBs. The certification of these products is an ongoing process and additional ratings and certifications are continually being pursued. For information about compliance with a particular standard, contact your local Rockwell Automation sales office or Allen-Bradley distributor.

In each of the product sections, the latest certifications at the time of publication are listed for the specific product type.

Molded Case Circuit Breaker Thermal Protection

MCCBs provide thermal overcurrent protection and short-circuit protection. These devices provide this protection by using mechanical means with heater elements, or by using electronics to detect current flow and model the associated heat generated by the current.

When electronic MCCBs are applied, the ability to adjust the thermal trip rating to shape the trip curve is available and the result is that there are fewer trip units required to cover a wider range of current. Note: while a trip unit may have the capability of protecting the current range, in many cases a rating plug is used to limit the range of adjustability.

[Table 2](#) and [Table 3](#) illustrate the available thermal magnetic and electronic trip units and adjustment ranges available with the 140G family of MCCBs.

Applying Molded Case Circuit Breakers to North American Guidelines

The MCCB is most commonly used as either a feeder breaker or a single circuit breaker where disconnecting, short-circuit, and thermal protection functionality is required. When selecting an MCCB, you need to consider the following items.

- Application voltage
- Available short-circuit current
- Amperage of the load or wiring to be protected

Additionally, local code requirements will also need to be taken into consideration and these requirements may ultimately affect the type and functionality of the MCCB selected.

Molded Case Circuit Breakers

- Magnetic and thermal trip currents may be fixed or adjustable
- Must be sized per NEC/CEC rules
- May be used for motor circuits, but 140MG (MCP) is first choice
- Motor Current (thermal rating)
 - $\leq 250\%$ motor full load amperes (FLA)
 - $\leq 300\%$ for motors ≤ 100 A if the circuit trips on start
 - $\leq 400\%$ for motors ≥ 100 A if the circuit breaker trips on start
- Magnetic trip current is generally set at 1000% (10x) of circuit breaker thermal ratings
- May be UL Listed as part of UL 508/UL 60947-4-1
- May also be used for motor control-circuit transformers, but Bulletin 1489 miniature circuit breakers (MCBs) are a more appropriate choice

Motor Protection Circuit Breakers

Motor Protection Circuit Breakers are relatively new to the North American market. These devices are considered motor protection circuit breakers (MPCBs) outside of North America. Within North America they are defined as manual Type E self-protecting combination motor controllers.

- Sized at 100% of the motor full-load current (FLA)
- Motor current setting is adjustable (thermal rating)
- IEC & UL/CSA calibration requirements require overload to trip at 120 & 125% FLA
- Motor is able to run into the Service Factor when set at 100% of the motor current
- Magnetic Trip Current setting is adjustable (magnetic rating)
- Adjustable at 1300% (13x) highest motor current setting on circuit breaker
- Higher Magnetic Trip Current settings are available if circuit breaker trips on start (140M-C2T-***)
- Example of an MPCB using 140M-C2E-C10:
 - Motor Current is adjustable from 6.3...10 A
 - Set at 100% FLA for proper motor protection
 - Magnetic Trip Current is fixed at 130 A
 - This is where circuit breaker begins to trip in a "short-circuit" condition
- NEC/CEC (Canadian Electrical Code) do not specifically recognize this classification of circuit breaker and, therefore, do not describe how to size them (for example, 100% FLA sizing)

Motor Circuit Protectors

Motor circuit protectors (MCPs) are the most popular choice for motor circuits in the North American market. They have been used in combination starters and Motor Control Center unit inserts (buckets) for many years.

- Motor current setting (thermal) is not specified by NEC/CEC
- MCPs are magnetic only
- Thermal capability should be greater than or equal to motor FLA and less than or equal to overload relay setting
- Motor overload protection must be provided separately
- MCPs are UL Recognized
- Must be tested and listed with specific contactors and overloads
- UL Listing is obtained as part of UL 508/UL 60947-4-1
- Magnetic trip current is adjustable
- Adjustability is required by UL489 standard
- Must be sized per NEC/CEC rules
 - ≤ 800% motor FLA for standard efficiency motors
 - ≤ 1300% motor FLA allowed if motor will not start
 - ≤ 1100% motor FLA for high efficiency motors
 - ≤ 1700% motor FLA allowed if motor will not start
- Provide choice in overload protection

Selecting a Circuit Breaker, When Application is to Follow U.S. Guidelines

The next step is selecting a breaker for use in an industrial control panel. In the following section we will focus on the MCCB for use as a feeder and as a branch circuit protective device.

Selecting The MCCB for Use as The Main Disconnect or Feeder

A typical industrial control panel is a feeder circuit as defined by the NEC, where a feeder is composed of the wires between the service entrance of the panel or line side of the MCCB and the line side of the branch protective devices.

In many industrial control applications, motor control is involved. In that case, the application must then follow Article 430 of the NEC, which states that breakers for feeders having mixed loads, e.g. heating (lighting and heat appliances) and motors should have ratings suitable for carrying the heating loads, plus the capacity required by the motor loads.

For motor loads, NEC Article 430 states that breakers for motor feeders shall have a rating not greater than the sum of the highest breaker rating of any of its branches and the full-load currents of all other motors served by the feeder.

Feeder Breaker Thermal Rating Selection Example

This assumes that the circuit breaker selected has a voltage rating equal or greater than the application and that the interrupting rating is equal or greater to the available short-circuit current. The panel contains a main feeder breaker supply with three motor branch circuits.

In our application, the feeder is supplying a 3-motor system at a voltage of 480V.

- Motor 1 is 10 Hp. Current value from Table 430.250 of the NEC is 14 A.
- Motor 2 is 5 Hp. Current value from Table 430.250 of the NEC is 7.6 A.
- Motor 3 is 5 Hp. Current value from Table 430.250 of the NEC is 7.6 A.

Calculation of panel wiring includes:

- **For single motors:** Per [430.22], size motor branch circuit conductors no smaller than 125 percent of the motor FLC rating listed in Table 430.147 or 430.148 (Figure 430-4). Size the branch circuit short-circuit and ground-fault protection device per 240.6(A) and 430.52(C)(1) Ex. 1.

- **For multiple motors.** Per [430.24], size multiple motor conductors as follows. First, multiply the full-load current rating of the highest-load motor by 1.25. Then, add up the full-load current ratings of all the other motors in the group. Add these two numbers. That's your motor load for calculating ampacity. Add any other loads on that conductor, to calculate total conductor ampacity.

Current Calculation is:

Motor 1 (14 A * 1.25)	17.5 A
Motor 2	7.6 A
Motor 3	7.6 A
Total	32.7 A

Since the total load comes to 32.7 A and there is not a commercially available breaker available for 32.7 A, the NEC allows the next largest standard-sized breaker to be used. Therefore, a 35 A MCCB could be selected to protect this control panel. Note: each motor branch also needs protection.

Thermal Magnetic Circuit Breakers Used as Branch Short-circuit Devices

It is also possible to use an MCCB as a branch protective device for a motor load, and while we will show the calculation for applying an MCCB in this manner, there are other circuit breakers, such as the MCP and MPCB, that are better suited for this application. After the calculation for sizing is completed, it should be apparent that even though this is technically correct, in some cases, the motor protection and wire protection can be less than ideal.

Per NEC Article 430.52(B), the motor branch circuit short-circuit and ground fault device shall be capable of carrying the starting current of the motor. Further, 430.52(C) indicates that the protective device that has a rating or setting not exceeding the value calculated according to the values given in Table 430.52 shall be used. In the case of an inverse time MCCB, such as the 140G, the calculation for the maximum setting or rating of the protective device is 250% of the motor being protected. [Figure 1 on page 4](#) shows an example of this type of configuration.

Example

An MCCB is being used to protect a branch motor circuit with a 10 Hp 460V motor. Using Table 430.250 of the NEC, a value of FLC of 14 A is supplied for this motor.

Calculating the maximum branch circuit protective device rating or setting is:

$$14 \text{ A} * 250\% = 35 \text{ A}$$

Therefore, the maximum size MCCB that could be used in this example is 35 A. This is the maximum rating and therefore smaller devices could be selected for this application. A point to consider is that generally MCCBs have a magnetic trip of approximately 10X the rating of the MCCB. When starting, motors usually exhibit an inrush characteristic of 6 to 10 times the full load rating of the motor, depending on the type of motor being used. In this case, the circuit breaker trip point is approximately 350 A and the motor starting current of locked rotor current is approximately 140 A if a 10x ratio of running to starting current is assumed. A smaller breaker could be selected without concern for nuisance tripping. In that case, there may be more concern about the thermal protection provided by the circuit breaker being based on a 35 A breaker with only a 14 A load. The motor and the wiring may not be adequately protected if larger wire isn't selected or if a motor overload relay is not used.

MCCB Application and Sizing

The Bulletin 140G MCCBs are traditionally used for protection of branch and feeder circuit in an industrial control application. In the role of a feeder circuit breaker, the MCCB provides isolation and short-circuit protection for the panel and thermal protection for the feeder wires and as a branch circuit breaker provides the same protection for the branch wires in the panel. For illustrative purposes, the feeder will be shown at the wiring from the load side of the main or feeder MCCB to the line connection of the branch short-circuit protective devices to which the feeder is supplying power.

The following example is a generic interpretation of the US National Electrical Code (NEC), and should be used only as a reference for applying the MCCB. Final authority regarding the sizing and components used is governed by local and/or

national electrical standards and the Jurisdiction Having Authority. Consult these standards before installing or designing any electrical system using short-circuit protective devices (SCPDs).

While this discussion is not intended to be a comprehensive guidebook to designing industrial control panels, we will present several categories of typical applications where a feeder SCPD device will be applied:

- A panel where only motor loads are being fed by the breaker
- A panel where fixed loads are being fed by the breaker
- A panel where mixed loads are being protected by the feeder breaker

In all cases, the examples given here are for reference and users should reference their local electrical code requirements, as they may vary from location to location. The applicator should verify that their selection and installation complies with local codes, regulations, and/or standards.

A feeder is composed of the conductors of a wiring system between the service equipment or the generator switchboard of an isolated plant and the branch circuit overcurrent device.

NEC Article 220 states:

Where a feeder supplies continuous loads or any combination of continuous and noncontinuous loads, the rating of the overcurrent device shall not be less than the noncontinuous load plus 125% of the continuous load. Exception: Where the assembly including the overcurrent devices protecting the feeder(s) are listed for operation at 100% of their rating, neither the ampere rating of the overcurrent device nor the ampacity of the feeder conductors shall be less than the sum of the continuous load plus the noncontinuous load. Only breakers listed for 100% application, and so labeled can be applied under the exception (for example N Frame and R Frame 140G devices that are specifically marked and rated 100%). Breakers without a 100% application listing and label are applied at 80% of rating.

NEC Article 430 states:

Breakers for feeders having mixed loads; e.g., heating (lighting and heat appliances) and motors, should have ratings suitable for carrying the heating loads plus the capacity required by the motor loads. . . breakers for motor feeders shall have a rating not greater than the sum of the highest breaker rating of any of its branches and the full load currents of all other motors served by the feeder.

A molded case circuit breaker is rated in rms amperes at a specific ambient temperature. This ampere rating is the maximum continuous current it may carry in the ambient temperature for which it is calibrated. To minimize the need for derating, Allen-Bradley thermal magnetic breakers are calibrated for an ambient temperature of 40 °C (104 °F), which is the average temperature within an enclosure. If the enclosure ambient temperature is known to exceed 40 °C, the breaker used should either be specially calibrated for that temperature, or be derated accordingly.

80% Continuous Rated

All 140G Molded Case Circuit Breakers are rated for 80% continuous load unless marked for 100% loads. The NEC requires that only 100% rated continuous load be marked special with the load designation. In all general applications the unmarked circuit breaker is to be applied at no more than 80% continuous load of its rated current (I_n). Typically 100% rated current MCCBs are devices with electronic trip units. The 140G product line has 100% rated electronic trip MCCBs. Visit www.rockwellautomation.com for specific devices.

Cable Selection

UL Listed circuit breakers rated 125 A or less shall be marked as being suitable for 60 °C (140 °F), 75 °C (167 °F) only or 60/75 °C (140/167 °F) wire. All Allen-Bradley breakers rated 125 A or less are marked for 60/75 °C wire. All UL Listed circuit breakers rated over 125 A are suitable for 75 °C conductors. Conductors rated for higher temperatures may be used, but must not be loaded to carry more current than the 75 °C ampacity of that size conductor for equipment marked or rated 75 °C, or the 60 °C ampacity of that size conductor for equipment marked or rated 60 °C. However, the full 90 °C (194 °F) ampacity may be used when applying derating factors, so long as the actual load does not exceed the lower of the derated ampacity or the 75 °C or 60 °C ampacity that applies.

Unusual Operating Conditions

Operation below 0 °C

Bulletin 140G MCCBs may be applied in ambient temperatures (near the MCCB within an enclosure) below 0 °C. Applications below 0 °C must consider the possibility of ice forming within or on the MCCB and interfering with the internal or external operating mechanisms. All ratings below 0 °C are based on the absence of freezing water or other elements.

Trip Unit Temperatures

Thermal magnetic circuit breakers are temperature sensitive. At ambient temperatures below 40 °C (104 °F), circuit breakers may carry more current than their continuous current rating. Nuisance tripping is not a problem under these lower temperature conditions, although consideration should be given to closer protection coordination to compensate for the additional current-carrying capability. In addition, the actual mechanical operation of the breaker could be affected if the ambient temperature is significantly below the 40 °C standard.

For ambient temperatures above 40 °C, breakers should carry less current than their continuous current rating. Under this condition, the circuit breaker should be derated for the higher ambient temperature.

Electronic trip units are insensitive to ambient temperatures within a certain temperature range. The temperature range for most electronic trip units is -25 °C...+70 °C (-13 °F...+158 °F). Allen-Bradley MCCBs are designed to include temperature protective circuits that initiate a tripping operation and provide self-protection, should the internal temperature rise to an unsafe level.

Circuit Breaker Temperatures

The temperature of the air immediately surrounding a circuit breaker is the ambient temperature. All Allen-Bradley standard breakers are calibrated to a 40 °C ambient temperature. For any ambient temperature application significantly above or below 40 °C, it is recommended that rerating of the circuit breaker be considered or Rockwell Automation be consulted about any possible re-rating.

Altitude

Low voltage circuit breakers must be derated for voltage and interrupting rating at altitudes above 2000 m (6560 ft) above sea level. The thinner air at higher altitudes reduces cooling and dielectric characteristics compared to the denser air found at lower altitudes.

Use the following [Table 4](#) and [Table 5](#) to derate as appropriate.

Table 4 - Voltage Rating

Voltage Rating Operational Voltage U_e [V]				
Altitude	2000 m (6560 ft)	3000 m (9840 ft)	4000 m (13,120 ft)	5000 m (16,400 ft)
All Frames	100%	90%	79%	67%

Table 5 - Current Rating

Current Rating Rated Uninterrupted Current I_u [A]				
Altitude	2000 m (6560 ft)	3000 m (9840 ft)	4000 m (13,120 ft)	5000 m (16,400 ft)
All Frames	100%	98%	93%	90%

Unusual Mounting Configurations

Generally, circuit breakers may be mounted in any position, up or down, horizontal or vertical, without affecting the tripping characteristics or interrupting rating. However, mounting circuit breakers in a vertical position with the ON position other than UP will be in violation of Article 240-81 of the NEC.

Tropicalization

The 140G/MG Circuit breakers are tested in compliance with IEC Standards, making these devices suitable for hot-humid conditions defined in IEC 60721-2-1, climatograph 8. These devices include:

- Moldings of glass fiber reinforced synthetic resins
- Metallic parts treated for anti-corrosion
- Zinc plating protected by a conversion layer (hexavalent-chromium free)
- Electronic circuits protected for anti-condensation

Electromagnetic Compatibility

The 140G/MG Circuit Breakers electronic trip units and electronic residual current releases are in compliance with EN 60947-2 Appendix B and Appendix F and European Directive No. 2004/108/EC regarding EMC – electromagnetic compatibility.

Maintenance Mode (MM)

Maintenance Mode (MM) offers a preset set of protection parameters. MM allows systems testing when the molded case circuit breaker is energized or ON. This feature is a manual adjustment on the molded case circuit breaker, via a DIP switch. Preset values for Maintenance Mode are indicated in the selection guide for each frame size.

Shock and Vibration

Allen-Bradley Molded Case Circuit Breakers are shock tested to conform with IEC 60068-2-27, and vibration tested to IEC 60068-2-6.

Table 6 - MCCB Shock and Vibration Test Values

Bul. 140G MCCB Frame Size	Vibration	Shock (peak acceleration)
G	2 ... 13.2 Hz \pm 1 mm; 13.2 ... 100 Hz \pm 0.7 g	150m/s ² peak; pulse duration 11 ms
H		
I		
J		120m/s ² peak; pulse duration 11 ms

Allen-Bradley Molded Case Circuit Breakers

The Bulletin 140G family of Molded Case Circuit Breakers (MCCBs) offers a wide range of features include thermal/magnetic and electronic protection devices, high interrupting/breaking capacities and complete line of factory and field installed accessories. The Bulletin 140G MCCBs are ideal for use in line protection of control panels.

Molded case circuit breakers have the following features:

- 10...3000 A current range
- 3- and 4-pole devices
- Space-saving dimensions
- End cap/bolt-on terminals are standard
- Thermal/Magnetic protection: 15...800 A
- Electronic protection: 10...3000 A
- Approved for global application: UL, CSA, CCC, and IEC performance interrupting/breaking capacity
- Wide range of mounting options
- Extensive range of factory- or field-installed accessories

Molded Case Circuit Breakers Product Selection

125 A, G-Frame Molded Case Circuit Breakers

Catalog Number Explanation

Complete Circuit Breaker Assemblies with Factory-Installed Options

Examples given in this section are not intended to be used for product selection. Use ProposalWorks™ to configure the molded case circuit breaker. These configurations are for selection of all factory-installed options for shunt trips, undervoltage release units, auxiliary contacts, and alarm contacts. Use the codes from Table g to add on to the molded case circuit breaker catalog number selected on the following pages to form a complete cat. no. with factory-installed options. ProposalWorks is available from <http://www.rockwellautomation.com/global/e-tools/overview.page>. Note: Terminal lugs are not supplied and can be ordered separately. See [page 85](#) for available lugs.

125 A, H-Frame Molded Case Circuit Breakers

Catalog Number Explanation

Complete Circuit Breaker Assemblies — 125 A, H-Frame

Examples given in this section are not intended to be used for product selection. Use ProposalWorks to configure the molded case circuit breaker. These configurations are for selection of all factory-installed options for shunt trips, undervoltage release units, auxiliary contacts, trip units, and alarm contacts. Use the codes from Table g to add on to the molded case circuit breaker cat. no. selected on the following pages to form a complete cat. no. with factory-installed options. ProposalWorks is available from <http://www.rockwellautomation.com/global/e-tools/overview.page>. Note: Terminal lugs are not supplied and can be ordered separately. See [page 85](#) for available lugs.

225 A I-Frame Case Circuit Breakers

Catalog Number Explanation

Complete Circuit Breaker Assemblies — 225 A, I-Frame

Examples given in this section are not intended to be used for product selection. Use ProposalWorks to configure the molded case circuit breaker. These configurations are for selection of all factory-installed options for shunt trips, undervoltage release units, auxiliary contacts, and alarm contacts. Use the codes from Table g to add on to the molded case circuit breaker cat. no. selected on the following pages to form a complete cat. no. with factory-installed options. ProposalWorks is available from <http://www.rockwellautomation.com/global/e-tools/overview.page>. Note: Terminal lugs are not supplied and can be ordered separately. See [page 85](#) for available lugs.

400 A, K-Frame Molded Case Circuit Breakers

Catalog Number Explanation

Complete Circuit Breaker Assemblies — 400 A, K-Frame

Examples given in this section are not intended to be used for product selection. Use ProposalWorks to configure the molded case circuit breaker. These configurations are for selection of all factory-installed options for shunt trips, undervoltage release units, auxiliary contacts, and alarm contacts. Use the codes from Table g to add on to the molded case circuit breaker cat. no. selected on the following pages to form a complete cat. no. with factory-installed options. ProposalWorks is available from <http://www.rockwellautomation.com/global/e-tools/overview.page>. Note: Terminal lugs are not supplied and can be ordered separately. See [page 85](#) for available lugs.

Maintenance Mode (MM)

Maintenance Mode (MM) offers a preset set of protection parameters. MM allows systems testing when the molded case circuit breaker is energized or ON. The following table lists the preset values for Maintenance Mode.

Rated Current I_n [A]	L		S		I	G		MM
	$I_1=1 \times I_n$	$t_1=MAX \text{ sec.}$	$I_2=OFF$	$t_2=OFF \text{ sec.}$	$I_3=4 \times I_n$	$I_4=OFF$	$t_4=OFF \text{ sec.}$	$I_5=2.5 \times I_n$
300	300	18	—	—	1200	—	—	750
400	400	18	—	—	1600	—	—	1000

Figure 7 - Maintenance Mode Basic Wiring Diagram

800 A, M-Frame Molded Case Circuit Breakers

Catalog Number Explanation

Complete Circuit Breaker Assemblies — 800 A, M-Frame

Examples given in this section are not intended to be used for product selection. Use ProposalWorks to configure the molded case circuit breaker. These configurations are for selection of all factory-installed options for shunt trips, undervoltage release units, auxiliary contacts, and alarm contacts. Use the codes from Table g to add on to the molded case circuit breaker cat. no. selected on the following pages to form a complete cat. no. with factory-installed options. ProposalWorks is available from <http://www.rockwellautomation.com/global/e-tools/overview.page>. Note: Terminal lugs are not supplied and can be ordered separately. See page 85 for available lugs.

Maintenance Mode (MM)

Maintenance Mode (MM) offers a preset set of protection parameters. MM allows systems testing when the molded case circuit breaker is energized or ON. The following table lists the preset values for Maintenance Mode.

Rated Current I_n [A]	L		S		I	G		MM
	$I_1=1 \times I_n$	$t_1=MAX \text{ sec.}$	$I_2=OFF$	$t_2=OFF \text{ sec.}$	$I_3=4 \times I_n$	$I_4=OFF$	$t_4=OFF \text{ sec.}$	$I_5=2.5 \times I_n$
600	600	18	—	—	2400	—	—	1500
630 ⁽¹⁾	630	18	—	—	2520	—	—	1575
800	800	18	—	—	3200	—	—	2000

(1) IEC only.

Figure 8 - Maintenance Mode Basic Wiring Diagram

1200 A, N-Frame Molded Case Circuit Breakers

Catalog Number Explanation

Complete Circuit Breaker Assemblies — 1200 A, N-Frame

Examples given in this section are not intended to be used for product selection. Use ProposalWorks to configure the molded case circuit breaker. These configurations are for selection of all factory-installed options for shunt trips, undervoltage release units, auxiliary contacts, and alarm contacts. Use the codes from Table [h](#) to add on to the molded case circuit breaker cat. no. selected on the following pages to form a complete cat. no. with factory-installed options. ProposalWorks is available from <http://www.rockwellautomation.com/global/e-tools/overview.page>. Note: Terminal lugs are not supplied and can be ordered separately. See [page 85](#) for available lugs.

Maintenance Mode (MM)

Maintenance Mode (MM) offers a preset set of protection parameters. MM allows systems testing when the molded case circuit breaker is energized or ON. The following table lists the preset values for Maintenance Mode.

Rated Current I_n [A]	L		S		I	G		MM
	$I_1=1 \times I_n$	$t_1=MAX \text{ sec.}$	$I_2=OFF$	$t_2=OFF \text{ sec.}$	$I_3=4 \times I_n$	$I_4=OFF$	$t_4=OFF \text{ sec.}$	$I_5=2.5 \times I_n$
1200	480... 1200	3... 144	—	—	—	—	—	3000

Trip Units, Electronic LSI (Long, Short, Instantaneous), LSI-MM (Long, Short, Instantaneous, Ground Fault - Maintenance Mode)

	Rated Current I_n [A]	Protection Type	Cat. No. ⁽¹⁾
	1200	H (LSI)	140G-NTH-E12
	1200	I (LSIG)	140G-NTI-E12
1200	K (LSIG-MM)	140G-NTK-E12	

(1) Supplied installed with each MCCB. The Cat. Nos. listed are replacement parts.

Table 62 - Rating Plugs⁽¹⁾

Rated Current I_n [A]	Cat. No.	Rated Current I_n [A]	Cat. No.	Rated Current I_n [A]	Cat. No.
400	140G-NRP-D40	800	140G-NRP-D80	1200	140G-NRP-E12
600	140G-NRP-D60	1000	140G-NRP-E10	1250 (IEC only)	140G-NRP-E125

(1) 1200 A rating plug is supplied installed from the factory for all N frame MCCBs. For all other rating currents, the rating plug must be ordered separately for field installation.

1200 A, NS-Frame Molded Case Circuit Breakers

Catalog Number Explanation

Complete Circuit Breaker Assemblies — 1200 A, NS-Frame

Examples given in this section are not intended to be used for product selection. Use ProposalWorks to configure the molded case circuit breaker. These configurations are for selection of all factory-installed options for shunt trips, undervoltage release units, auxiliary contacts, and alarm contacts. Use the codes from Table [h](#) to add on to the molded case circuit breaker cat. no. selected on the following pages to form a complete cat. no. with factory-installed options. ProposalWorks is available from <http://www.rockwellautomation.com/global/e-tools/overview.page>. Note: Terminal lugs are not supplied and can be ordered separately. See [page 85](#) for available lugs.

Maintenance Mode (MM)

Maintenance Mode (MM) offers a preset set of protection parameters. MM allows systems testing when the molded case circuit breaker is energized or ON. The following table lists the preset values for Maintenance Mode.

Rated Current I_n [A]	L		S		I	G		MM
	$I_1=1 \times I_n$	$t_1=MAX \text{ sec.}$	$I_2=OFF$	$t_2=OFF \text{ sec.}$	$I_3=4 \times I_n$	$I_4=OFF$	$t_4=OFF \text{ sec.}$	$I_5=2.5 \times I_n$
1200	480...1200	3...144	—	—	—	—	—	3000

Table 67 - Trip Units, Electronic LSI (Long, Short, Instantaneous), LSI-MM (Long, Short, Instantaneous, Ground Fault -Maintenance Mode)⁽¹⁾

	Rated Current I_n [A]	Protection Type	Cat. No.
	1200	H (LSI)	140G-NTH-E12
	1200	I (LSIG)	140G-NTI-E12
1200	K (LSIG-MM)	140G-NTK-E12	

- (1) Supplied installed with each MCCB. The Cat. Nos. listed are replacement parts.

Table 68 - Rating Plugs⁽¹⁾

Rated Current I_n [A]	Cat. No.	Rated Current I_n [A]	Cat. No.
400	140G-NRP-D40	1000	140G-NRP-E10
600	140G-NRP-D60	1200	140G-NRP-E12
800	140G-NRP-D80	1250 ⁽²⁾	140G-NRP-E125

- (1) 1200 A rating plug is supplied installed from the factory for all NS-Frame MCCBs. For all other rating currents, the rating plug must be ordered separately for field installation.
- (2) IEC only.

2500...3000 A, R-Frame Molded Case Circuit Breakers

Catalog Number Explanation

Complete Circuit Breaker Assemblies — 2000...3000 A, R-Frame

Examples given in this section are not intended to be used for product selection. Use ProposalWorks to configure the molded case circuit breaker. These configurations are for selection of all factory-installed options for spring charging motor with shunt trip and close [for remote control], or separate installation of shunt trip and undervoltage release units. Use the codes from Tables [h](#) and [i](#) to add on to the molded case circuit breaker cat. no. selected on the following pages to form a complete cat. no. with factory-installed options. ProposalWorks is available from <http://www.rockwellautomation.com/global/e-tools/overview.page>.

Maintenance Mode (MM)

Maintenance Mode (MM) offers a preset set of protection parameters. MM allows systems testing when the molded case circuit breaker is energized or ON. The following table lists the preset values for Maintenance Mode.

Rated Current I_n [A]	L		S		I	G		MM
	$I_1=1 \times I_n$	$t_1=MAX sec.$	$I_2=OFF$	$t_2=OFF sec.$	$I_3=4 \times I_n$	$I_4=OFF$	$t_4=OFF sec.$	$I_5=2.5 \times I_n$
300	300	18	—	—	1200	—	—	750
400	400	18	—	—	1600	—	—	1000

Figure 9 - Maintenance Mode Basic Wiring Diagram

Motor Circuit Protectors Product Selection

Motor Circuit Protectors

- Current range 0.16...1200 A
- End cap/bolt-on terminals are standard
- UL Listed/Recognized for motor loads
 - Short-circuit protection - magnetic trip
 - Overload protection must be provided separately
- Visible trip indication
- High current limiting
- High switching capacity

The Bulletin 140MG Motor Circuit Protectors provide short-circuit protection for individual motor loads. Factory-installed internal accessories make installation and wiring easy.

General Information

Motor Circuit Protectors may provide the following protective and control functions.

- Disconnect for motor branch circuit
- Branch-Circuit, short-circuit protection (magnetic protection)
- Switching (manual)

In North America, electrical codes require that an individual Motor Branch Circuit be protected by a UL/CSA Listed fuse, circuit breaker or self-protected combination motor controller.

140MG-G, H, I, J, K, M and N Frames

The 140MG-G, H, I, J, K, M and N-Frame motor circuit protectors are UL/CSA Recognized as circuit breakers. They are UL/CSA Recognized, rather than UL/CSA Listed, since they only provide short-circuit protection and not thermal overload protection for the motor.

Standards Compliance and Certifications

Standards Compliance	Certifications
IEC 60947-2	CE Marked
UL489	CSA Certified (File No. LR1234)
CSA22.2, No. 5	UR Recognized (File No. E224135)
	CCC

Catalog Number Explanation— 125 A, G-Frame and 150 A, I-Frame

Examples given in this section are not intended to be used for product selection. Use these configurations only to select all factory-installed options for shunt trips, undervoltage release units, auxiliary contacts, and alarm contacts. Use the codes from Table f to add on to the motor circuit protector cat. no. selected on the previous pages to form a complete cat. no. for a complete assembly with factory-installed options. Note: Terminal lugs are not supplied and can be ordered separately. See [page 85](#) for available lugs.

(1) The Hp and kW ratings shown are for reference only. The final selection of the MCP should be made based on motor full load current and the requirements of local electrical codes.

(2) The interrupting rating for MCPs is dependent upon the controller used. Please see the global short-circuit ratings tables at <http://www.rockwellautomation.com/global/support/global-sccr.page>, or contact your local Rockwell Automation sales office or Allen-Bradley distributor.

(3) I_3 is adjustable between 1...10x motor FLA. Values based on 1200 A rating plug.

Motor Protection Circuit Breakers Product Selection

Motor Protection Circuit Breakers

Cat. No. 140MG-H...

Cat. No. 140MG-J...

Motor Protection Circuit Breakers have the following features:

- 10...150 A current range
- UL Listed for motor loads
- Adjustment features
 - Rated motor current adjustable from $0.4...1 \times I_n$
 - Overload protection [L] Class 3E, 5E, 10E, and 20E
 - Unbalance L1, L2, L3 detection [U] adjustable either ON or OFF, alarm at 10% unbalance, trip at 50% unbalance, T=2 seconds
 - Short-circuit protection [I], electronic magnetic trip adjustable from $6...13 \times I_n$
- LED visible warnings and trip indication
- Manual settings using DIP switches
- End cap/bolt-on terminals are standard

Standards Compliance and Certifications

Standards Compliance	Certifications
IEC 60947-2	CE Marked
UL489	CCC
CSA22.2, No. 5	CSA Certified (File No. LR1234)
UL 60947-4-1A	UL Listed
	HACR Type E197878

Catalog Number Explanation

Complete Motor Protection Circuit Breaker Assemblies with Factory-Installed Options

Examples given in this section are not intended to be used for product selection. Use these configurations only to select all factory-installed options for shunt trips, undervoltage release units, auxiliary contacts, and alarm contacts. Use the codes from Table f to add on to the motor protection circuit breaker cat. no. selected on the previous pages to form a complete cat. no. for a complete assembly with factory-installed options. Note: Terminal lugs are not supplied and can be ordered separately. See [page 85](#) for available lugs.

150	60...150				140MG-J8E-D15

(1) Select the Motor Protection Circuit Breaker based on the motor FLC.

Molded Case Switches

- 125...2500 A current range
- 3- and 4-pole devices
- End cap/bolt-on terminals are standard
- These switches are like an MCCB, but they are not supplied with thermal overload protection
- Self Protecting, supplied with instantaneous magnetic trip override
- Suitable for use as Motor Branch Circuit and Motor Disconnect
- Must be protected on the supply side of the switch against short-circuits.

(1) Does not provide overcurrent protection; may open above this current value
 (2) 50V DC with 3 poles in series.

Notes:

Internal Electrical Accessories

Photos in this section are representative. Appearance of actual accessory may differ from the photo shown.

Auxiliary/Alarm Contact (AX/AL)

Functionality

[Figure 10](#) through [Figure 13](#) show the position of contacts at various points in the circuit breaker operation.

[Figure 10](#) shows the position of the auxiliary contacts (AX), alarm contacts (AL), or thermal trip (TU) AL contacts when they are installed and the circuit breaker is ON or the AX contact not installed.

Figure 10 - Auxiliary, Alarm, or Trip Unit Alarm Contact Position—Circuit Breaker ON

Diagram in bold indicates contact position when installed in the ON position

[Figure 11](#) shows the position of the contacts when the circuit breaker is OFF

Figure 11 - Auxiliary, Alarm, or Trip Unit Alarm Contact Position—Circuit Breaker OFF

Diagram in bold indicates contact position when installed in the OFF position

Figure 12 shows the position of the contacts when the circuit breaker is TRIPPED via the TEST Button on the face of the circuit breaker or shunt trip or undervoltage release

Figure 12 - Auxiliary, Alarm, or Trip Unit Alarm Contact Position—Tripped via TEST Button

Diagrams in bold indicate contact position when the circuit breaker is tripped via the test button

Figure 13 shows the position of the contacts when the circuit breaker trip unit has TRIPPED. This can occur from fault current of thermal overload or via the Test button on the center pole of thermal-magnetic trip units.

Figure 13 - Auxiliary, Alarm, or Trip Unit Alarm Contact Position—Circuit Breaker Tripped

Diagrams outlined in bold indicate contact position when the circuit breaker has tripped

Auxiliary/Alarm Contact Features

Auxiliary and alarm contacts are supplied in multiple variations for customer application.

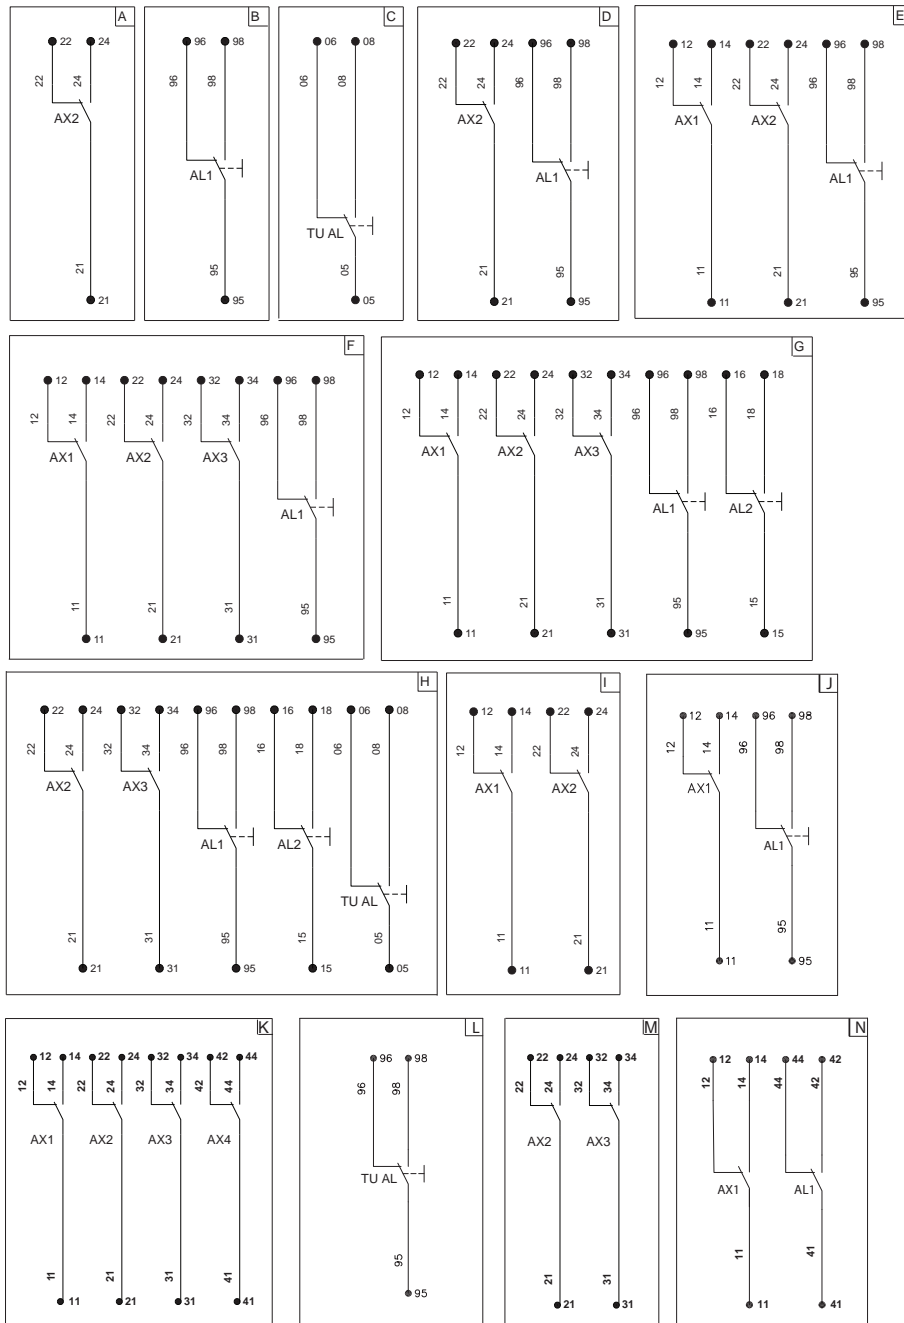

- Auxiliary Contacts (AX) : Indicate ON/OFF status of the MCCB.
- Alarm Contacts (AL): Indicate trip status of the MCCB. Alarm trip can be initiated by pressing the test button on the molded case circuit breaker, a trip due to overcurrent, short circuit; or trip due to residual current, shunt, or undervoltage release signals.
- Thermal Trip Contacts (TU): Trips only when the MCCB has detected an overcurrent, short-circuit, or protection trip. H- and J-Frame MCCBs have a button to test this feature. Available only for H, J, N, and NS frames.

These contacts are installed by removing the MCCB cover and accessing right-side pockets within the breaker with snap-in mounting provisions. Frames G...M are supplied with 1 meter (39 in.) pig tail wiring, with each terminal wire marked. Frames N and NS are wired internal to the breaker and are terminated for connection using a 3-pin quick connector.

(1) This contact is supplied with unmarked wires. The contact can function as either an auxiliary or alarm contact, depending on connection method.

Figure 14 - Auxiliary/Alarm Contact Diagrams

Shunt Trip (SNT)

- Allows remote tripping of the MCCB by applying control voltage to the shunt trip coil.
- Frames G, H, I, J, K, and M are supplied with 1 meter (39 in.) pig-tail wiring (each terminal wire is marked).
- Frames N and NS are wired internal to the breaker and terminated for connection using a 3-pin quick connector.

	380...400V AC				140G-N-SNB

(1) For N- and NS-Frame devices, terminals C1 and C2 are designated C11 and C12.

Shunt Close (SNC)

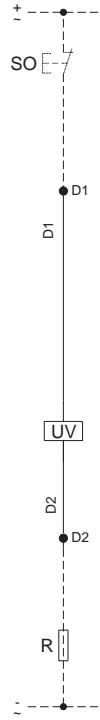

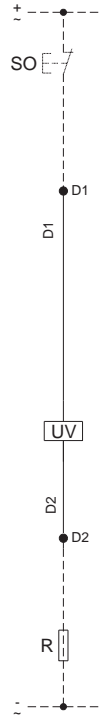

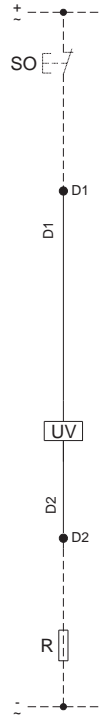

- For use with motorized versions of the NS-Frame MCCB.
- Allows remote closing of the MCCB when the spring motor is charged.

The shunt close unit is wired internal to the MCCB and terminated for connection using a 3-pin quick connect.

Description		Diagram	Frame Size	Cat. No.

Undervoltage Release (UVR)

- Opens the MCCB when supply voltage drops below 0.7 of the UV relay, with a trip rating from 0.7...0.35.
- The MCCB can be reset when the supply voltage is higher than 0.85 of the relay rating.
- When the UV is de-energized it is not possible to close the main contacts on the MCCB.
- R Resistor is supplied with the MCCB when reset is required.
- Frames G,H,I,J,K, and M are supplied with 1 meter (39 in.) pig-tail wiring (each terminal wire is marked).
- Frames N and NS are internally wired to the breaker and terminated for connection using a 3-pin quick connector.

Residual Current Release Module (IEC Only)

The residual current release module provides protection against low levels of earth (ground) fault currents. It continuously monitors the insulation. Compliant with IEC 60947-2 annex B, IEC 61000 for protection against unwarranted tripping.

Mechanical Accessories

Terminal Lugs

You can use mechanical terminal lugs to terminate line and load wiring to the MCCB. The 140G product line includes, as standard, the capability to terminate wiring using customer furnished “crimp-on” ring lug (ring tongue) or forked lug termination.

For customers who prefer terminating wiring to Mechanical Terminal Lugs, the 140G line offers a variety of mechanical terminals lugs to match the frame and application wiring.

Multiple tap terminal lugs are available for those customers terminating multiple wires to a MCCB pole, either to line or load connection. Use of a multi-tap connection can save on panel space, making wiring easier due to using (multiple) smaller diameter wire. For applications following the UL guidelines for panel short-circuit current rating (SCCR), the use of multiple wire termination on the load size permits the termination to be rated at the SCCR level of the circuit breaker, which may allow a higher SCCR than may be available using a separate power distribution block.

Phase Barriers

Phase barriers allow you to increase the insulation characteristics between the phases at the connections. Phase barriers provide additional electrical clearance between each phase when special connections extend past the circuit breaker housing. They are mounted from the front, even with the circuit breaker already installed.

	Description	Frame Size	Length	3-Pole Cat. No. (Pkg. Qty. 4)	4-Pole Cat. No. (Pkg. Qty. 6)

The table indicates the degrees of protection against intrusion and accidental contact according to IEC 60529.

Location	Without Terminal Covers	With High Terminal Covers ⁽¹⁾
A	IP40 ⁽²⁾	—
B	IP20 ⁽³⁾	IP40 ⁽²⁾
C	—	IP40 ⁽⁴⁾

- (1) High terminal covers have a height of 60 mm and are designated with a suffix "H" in the catalog number (140G-G-TC3H)
- (2) Also with direct or variable depth rotary operator.
- (3) G through M frames.
- (4) After installation.

Variable Depth Rotary Operating Kits

When you install MCCBs as the main or feeder circuit breaker in an industrial control panel and you use a non-flanged enclosure, a common method of operating the circuit breaker using a rotary operator mechanism. The use of a rotary operator converts a rotary motion to a vertical motion that “toggles” the MCCB. In this situation, the rotary operator kit consists of:

- External operating handle
- Operating shaft
- Circuit breaker-mounted rotary operating mechanism

Using these kits allows external operation of the circuit breaker with the capability of turning the circuit breaker on/off, or resetting it without having to open the enclosure. Traditionally, these kits are sold with an operating shaft that allows you to use the kit with enclosures of various depths. The operating handles will also provide status indication when the circuit breakers trip.

NFPA 79 Operators

A NFPA 79-compliant Internal Rotary Operating Handle Kit for Bulletin 140G MCCBs, and Bulletin 140MG MCPs and MPCBs is available to address current requirements of the NFPA 79 standard. The NFPA 79 kits are available for G-, H-, I-, J-, K-, M-, and N-Frame Circuit Breaker product lines.

Compliance with the current NFPA 79 standard enables you to maintain control of the main disconnecting means when the door is open; an issue for rotary-operated through-the-door disconnect switches and circuit breakers.

This standard requires that the rotary main disconnecting means be operable without the use of accessory tools or devices (independent of door position) and restates the requirement for an interlocking provision to prevent the closing of the disconnecting means while the enclosure door is open, unless the interlock is operated by a deliberate action. Without this requirement, rotary-operated devices may have a shaft protruding from the panel when the door is open. If the panel is powered and it is necessary to turn power off, it is difficult to de-energize the panel with the operating shaft alone. This standard is to reduce the possibility of personnel not being able to turn an energized panel off with the door opened.

Why is This Relatively Simple Product Important to You?

The trend in the market is moving toward building smaller and less-expensive control panels. To achieve this, many panel builders and OEMs have started using rotary operators because they are easier to install and the non-flanged enclosure is

significantly less expensive. With the introduction of this internal handle, customers can now comply with the NFPA 79 requirement and use the less-expensive, non-flanged enclosure with circuit breakers.

Applications Where NFPA 79 Compliance is Required as an Upgrade

From an installation perspective, the internal handle replaces the existing operating shaft. Externally, the same 140G handle is used. In the case of an existing 140G installation, installing the kit can be as simple as removing the existing operating shaft, measuring it, and then cutting the new internal operating handle shaft to the same length. It is then installed in place of the existing operating shaft.

Easy to Use, No-Tools-Required Internal Handle Operation

When the door is open, the kit provides an internal handle with a positive grip, allowing users to operate the breaker. If the enclosure were opened using the defeater on the external handle with the circuit breaker on, the user could then turn the breaker off using the internal handle, rather than using a tool to rotate the operating shaft.

Compliance with “Deliberate Action Required”

Finally, the handle complies with the NFPA 79 requirement to: “Prevent closing of the disconnecting means while the enclosure door is open, unless an interlock is operated by deliberate action.” The internal handle must be pulled out before it can be turned, otherwise the handle itself will just ratchet on the shaft.

Auxiliary Contacts for Handle Mechanism Mounting

- Early make contacts are (typically) used with an undervoltage release. The contacts close before the main contacts in the MCCB. The early make contacts supply power the undervoltage release, which prevents nuisance tripping of the relay.
- Early break contacts are used to remove system voltage from electronics that could be damaged by transient voltage caused by the opening of the main contacts in the MCCB.
- Mounted inside rotary mechanism or direct handle, supplied with 1 meter (39 in.) pig-tail wiring (each terminal wire is marked)

Motor Operators

The operating mechanism enables remote opening and closing of the circuit breaker and is particularly suitable for use in power supply network supervisory control systems. It comes complete with a padlock device.

The motor operating mechanism is fitted on the front of the circuit breaker as an alternative to the front flange or rotary operating mechanism. Motor-operated circuit breakers are normally used in applications where switching is done infrequently and generally are not used to replace contactors that are applied in series with the circuit breaker.

Flange-mounted Cable Operators—3-Pole Only

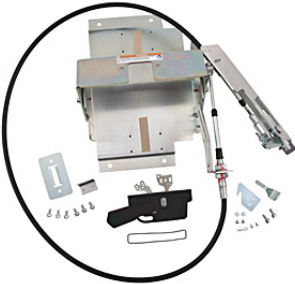

Flexible Cable Operators are useful accessories when you are installing a circuit breaker in a flanged enclosure and you need to control the MCCB externally. Traditionally in North America, flange operators that consist of operating rods or special mounting plates for the breakers have been used. In each case, the circuit breaker must be mounted directly or nearly directly behind the external handle, which is located on the flange. This type of installation is reliable; however, the positioning of the circuit breaker is less than ideal in terms of working room, especially in small enclosures.

The Flexible Cable Operator uses a similar flange-mounted operating handle to control the MCCB; however, rather than operating rods, the breaker is operated by a flexible cable, which provides flexibility in the circuit breaker placement. In many industrial control panels, incoming power to the panel may actually be on the hinged side of the panel and when using traditional flange-mounted operators, you need to route the main feeder wires across the panel to the line side of the MCCB. Using a flexible cable-operated MCCB allows you to install the MCCB closer to the incoming feeder wires.

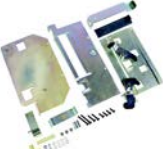

Another application where Flexible Cable Operators are used is in conjunction with busbar mounting systems installed within an industrial control panel. When an MCCB is being used on the busbar system as the main disconnect or feeder protector, the location of the feeder breaker isn't restricted to the area behind the flange.

Replacement Parts, G...NS Frames

End Cap Kits

All 140G MCCBs are furnished with end caps mounted on the circuit breaker as standard. Replacement end cap kits are available.

Many customers prefer to use a “crimp-on” ring lug (ring tongue terminal) or forked terminal as the wire termination method to the MCCB. Others prefer wire connection to a terminal lug. A broad selection of terminal lugs are available to meet specific application requirements.

The replacement end cap kit consists of a captive nut and bolt or termination screw, which allows you to terminate wires without the need to use terminal lugs.

	K	140G-BH3

Replacement Parts, R Frame

Internal Electrical Accessories

Auxiliary/Trip Unit Contact (AX1/AX2/AX3/AX4)

- Auxiliary Contacts (AX) : Indicate ON/OFF status of the MCCB.
- AX are Form C-style switches for internal MCCB wiring and are terminated with a 3-pin quick connector.

	Description	Designation	Diagram (page 82)	Frame Size	Cat. No.
	(3) Auxiliary contacts, 400V, (1) auxiliary contact, 24V	AX1/AX2/AX3/AX4	K	R	140G-R-EA3A1J

Shunt Trip (SNT)

- Allows remote tripping of the MCCB by applying control voltage to the shunt trip coil.
- Wired internal to the breaker and terminated with a 3-pin quick connector.

	Description	Diagram	Frame Size	Cat. No.
	24V DC	See page 82	R	140G-R-SNJ
	48V AC/DC			140G-R-SNKY
	110...120V AC/DC			140G-R-SND
	220...240V AC/DC			140G-R-SNA
	380...400V AC			140G-R-SNB

Shunt Close (SNC)

- Allows remote closing of the MCCB when the spring motor is charged.

The shunt close unit is wired internal to the MCCB and terminated with a 3-pin quick connect.

Description		Diagram	Frame Size	Cat. No.
	24V AC/DC	See page 82	R	140G-R-SNCJ
	48V AC/DC			140G-R-SNCKY
	110...120V AC/DC			140G-R-SNCD
	220...240V AC/DC			140G-R-SNCA
	380...400V AC			140G-R-SNCB

Undervoltage Release (UVR)

- Opens the MCCB when supply voltage drops below 0.7 of the UV relay, with a trip rating from 0.7...0.35.
- The MCCB can be reset when the supply voltage is higher than 0.85 of the relay rating.
- When the UV is de-energized it is not possible to close the main contacts on the MCCB.
- R Resistor is supplied with the MCCB when reset is required.

Description		Diagram	Frame Size	Cat. No.
	24V AC/DC	See page 91	R	140G-R-UVJ
	60V AC/DC			140G-R-UVKY
	110...120V AC/DC			140G-R-UVD
	220...240V AC/DC			140G-R-UVA
	380...400V AC			140G-R-UVB
	415...440V AC			140G-R-UVC

Additional Replacement Parts

Description		Diagram	Frame Size	Cat. No.
	Spring Charging Motor		R	220...250V DC
				110...130V AC/DC
				24...30V DC
				48...60V AC/DC
	Trip Reset Auxiliary contact allows remote reset of MCCB following an overcurrent trip		R	Form C, 24...30V AC/DC, PLC
				Form C, 110...130V AC/DC
				Form C, 200...240V AC/DC
	Battery Unit Used to interrogate the last trip of the MCCB when supplemental control power is not present or is lost.		R	140G-ELBU

Definitions

Threshold current: the rms symmetrical prospective at the highest interrupting capacity of the current limiting range, where:

- the peak current let-through in each phase is less than the peak of that symmetrical prospective current, and
- the I^2t in each phase is less than the I^2t of a 1/2 cycle wave of the symmetrical current

Interrupting rating: the highest current at rated voltage that a device is intended to interrupt under standard test conditions

I^2t (Amperes squared seconds): an expression related to the energy that is let through for a specific short circuit event. With respect to circuit breakers, the I^2t [A^2s] is expressed for the current flow between the initiation of the fault current and the clearing of the circuit.

I_p peak current: the maximum (or peak) instantaneous current that is allowed to pass during a specific short-circuit event. The value is determined from either a table as shown above or evaluated from a SCCR table based upon the available short circuit current at a specific voltage.

I_{rms} short-circuit current rating: the maximum rms prospective (available) current to which a device can interrupt. The rating is expressed in Amperes and volts.

- Adjustable between 1...10x motor FLA. Value based on 1200 A rating plug.
- The Short Circuit value is based on a combined of MCP, motor contactor and overload relay as a UL60497-4-1 Type D Combination Motor Controller, consult the [Global SCCR tool from Rockwell Automation](#).
- These ratings represent the standalone values for the MCP. For Type 2 coordinations values (per IEC60947-4) with Allen-Bradley contactors and overload relays, see the combination ratings in [Table 108](#). Consult the [Global SCCR tool from Rockwell Automation](#) for specific product catalog numbers.
- See [Table 107](#).
- Wire Temperature Rating is determined by testing the circuit breaker under full load current with the conductors sized for 40°C

Type D Combination Ratings

The short-circuit value is based on a combination of MCP, motor contactor, and overload relay, rated as a UL 60947-4-1 Type D Combination Motor Controller. Values in [Table 108](#) are for Type 2 coordination with Allen-Bradley contactors and overload relays.

Combination motor controller components:

- Circuit breaker—Bul. 140MG MCP, G-, H-, J-, K-, M-Frame
- Contactor—Bul. 100-C, 100S-C, 100-D, 100S-D
- Overload relay—Bul 193/592 E1 Plus™, E3™, E3 Plus, E300™

(1) IEC only.

Molded Case Switches and Motor Circuit Protectors

Molded case switches and motor circuit protectors do not undergo tripping variations because of ambient temperature. However, even though ambient temperature does not affect the tripping characteristic, for temperatures exceeding +40 °C it is advisable to reduce the maximum current to prevent terminal overheating.

[Table 110](#) shows the maximum current to prevent terminal overheating.

Electronic Trip Circuit Breakers, Molded Case Switches, and Motor Circuit Protectors

The electronic trip circuit breakers do not undergo tripping variations based on ambient temperature. However, even though ambient temperature does not affect the tripping characteristic, for temperatures exceeding +40 °C it is advisable to reduce the maximum current to prevent terminal overheating.

The same considerations are appropriate for molded case switches and motor circuit protectors.

[Table 112](#) shows the maximum current to prevent terminal overheating.

(1) Molded case switch rated current

140G R-Frame Electronic Trip Circuit Breakers and Molded Case Switches

The R frame electronic trip circuit breakers do not undergo tripping variations based on ambient temperature. However, even though ambient temperature does not affect the tripping characteristic, for temperatures exceeding +40 °C it is advisable to reduce the maximum setting for external thermal protection against overloads per the following.

The same considerations are appropriate for molded case switches, except instead of a current adjustment, the table should be used to reflect the maximum current at the specific temperature.

[Table 122](#) shows the maximum adjustment at which the threshold I_1 of the overcurrent protection (L) must be set according to the ambient temperature.

Table 122 - Maximum Operating Current above 40 °C (104 °F)—R-Frame Devices

Motor Operators

All motor operators are wired with 600V (UL/CSA) insulated wire. No voltage derating is required.

Using Trip Curves

One of the most common questions asked after, “How is an MCCB properly sized?” is, “How do I interpret the trip curves?”

A logical starting point is to explain what the curve actually is. The curve is a representation of how the circuit breaker will react to overcurrents and short-circuit currents. The curve is determined by a specific set of test conditions, and as such, you should use the curve as a guideline; real-world deviations from the test criteria may alter the individual results as compared to the curve.

Trip Curve for a Thermal-Magnetic MCCB

The most commonly selected form of thermal protection is the bimetallic version. This works similarly to a traditional overload relay in which a bimetallic element is heated, causing a deflection, which then exerts pressure on a trip bar and causes the circuit breaker to trip.

Figure 16 - Example Bimetallic Trip Curve

Using the bimetallic model, we can provide a thermal protection curve as shown here

Figure 17 - Example Thermal-magnetic MCCB Trip Curve

Combining the short-circuit and overcurrent protection provides us with a protection curve that looks like this.

Trip Curve for an Electronic MCCB

An alternative to using fixed-thermal protection is to use electronic overcurrent protection, which electronically replicates the function of the mechanical overcurrent device.

One of the benefits of using electronic trip units is their ability to tailor the tripping characteristics of the circuit breaker for the application.

The electronic trip unit has the ability to provide advanced protection in the form of additional trip functionality such as adjustable:

- Long Time – Allows the long time between 1.05 and ~1.3 x the thermal rating to be delayed, similar to how an adjustable relay changes classes
- Short Time – Adjustable short time between thermal and short-circuit
- Instantaneous Trip – Adjustable instantaneous short-circuit trip time
- Ground Fault – Adjustable time and value of ground fault tripping

[Figure 18](#) shows an example trip curve for electronic MCCBs.

Figure 18 - Example Electronic MCCB Trip Curve

L – Overcurrent protection long time delay
 S – Short-circuit protection short time delay
 I – Short-circuit protection instantaneous trip
 G – Ground fault protection

Electronic trip units are available in a variety of trip settings. The most common combinations are LSI, LSIG and M-LIV trip settings; therefore a wide variety of options exist for customizing the protection the circuit breaker provides within the control panel.

- Electronic trip unit. Long delay response, short delay with I^2t response, and instantaneous curve

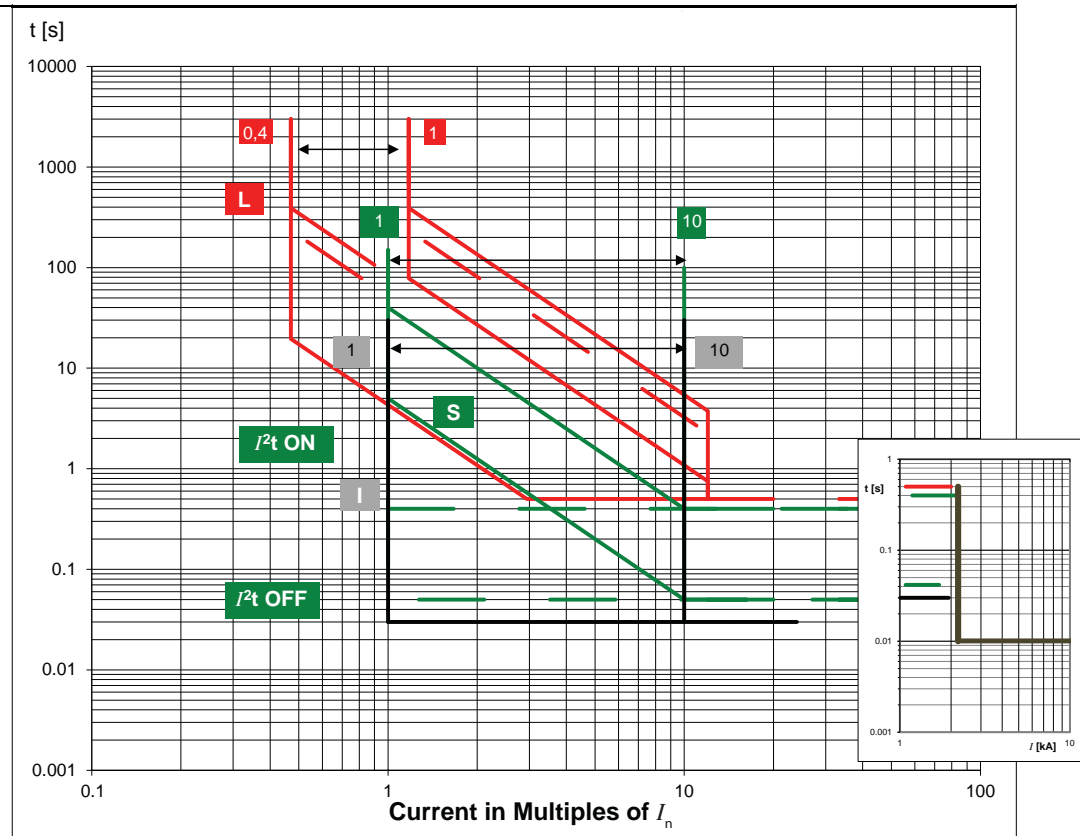

Table 132 - Tolerance Values

Protection	Trip Threshold	Trip Time
L	$1.05 \leq X I_1 \leq 1.25$	$\pm 20\%$
S	$\pm 10\%$	$\pm 20\%$
I	$\pm 15\%$	≤ 60 ms
Others	$\pm 20\%$	

Notes:

1. Curve accuracy applies from -20°C to $+55^\circ\text{C}$ ambient. For possible continuous ampere derating for ambient above 40°C , consult Rockwell Automation.
2. The right portion of the curve is determined by the interrupting rating of the circuit breaker.
3. Total clearing times shown include the response times of the trip unit, the breaker opening, and the interruption of the current.
4. For high fault current levels an additional fixed instantaneous hardware override is provided at $10.5 \times I_n$.

- Electronic trip unit. Long delay response, short delay with I^2t response, and instantaneous curve

Table 135 - Tolerance Values

Protection	Trip Threshold	Trip Time
L	$1.05 \leq x I_n \leq 1.25$	$\pm 20\%$
S	$\pm 10\%$	$\pm 20\%$
I	$\pm 15\%$	$\leq 60 \text{ ms}$
Others	$\pm 20\%$	

Notes:

1. Curve accuracy applies from -20°C to $+55^\circ \text{C}$ ambient. For possible continuous ampere derating for ambient above 40°C , consult Rockwell Automation.
2. The right portion of the curve is determined by the interrupting rating of the circuit breaker.
3. Total clearing times shown include the response times of the trip unit, the breaker opening, and the interruption of the current.
4. For high fault current levels an additional fixed instantaneous hardware override is provided at $10.5 \times I_n$.

Figure 48 - 140G-J Ground Fault Protection Curve for LSIG MCCBs

- Maximum voltage: 600V AC, 50/60 Hz
- Available sensors (I_n): 40 A, 60 A, 100 A, 150 A, 250 A

Example:

- $I_n = 100$ A
- $I_4 = 100 \times (0.2 + 0.25) = 45$ A
- $t_4 = 0.2$ s @ $I > I_4$

Table 136 - Ground Fault Current Ratings

I_n [A]	I_4 [I_n]						
	0.2	0.25	0.45	0.55	0.75	0.8	1
25	8	10	18	22	30	32	40
60	12	15	27	33	45	48	60
100	20	25	45	55	75	80	100
150	30	37.5	67.5	82.5	113	120	150
250	50	62.5	113	138	188	200	250

Table 141 - Trip Threshold Tolerance Values

Protection	Disable	Trip Threshold	Trip Time	Trip Threshold Tolerance	Trip Time Tolerance
L ($t = k/I^2$)		$I_1 = 0.4-0.425-0.45-0.475-0.5-1 \times I_n$	$t_1 = 3-12-24-36-48-72-108-144 \text{ s}^{(1)}$ @ $3I_1$	Release between 1.05 and $1.2 I_1$	$\pm 10\% I_g \leq 6 \times I_n$
S ($t = k$)	✓	$I_2 = 0.6-0.8-1.2-1.8-2.4-3-3.36-4.2-5.8-6.6-7.4-8.2-9-10 \times I_n$	with $I > I_2$ $t_2 = 0.1-0.2-0.3-0.4-0.5-0.6-0.7-0.8 \text{ s}$	$\pm 7\% I_g \leq 6 \times I_n$; $\pm 10\% I_g > 6 \times I_n$	The best of $\pm 10\%$ or $\pm 40 \text{ ms}$
S ($t = k/I^2$)	✓	$I_2 = 0.6-0.8-1.2-1.8-2.4-3-3.36-4.2-5.8-6.6-7.4-8.2-9-10 \times I_n$	$t_2 = 0.1-0.2-0.3-0.4-0.5-0.6-0.7-0.8 \text{ s}$ @ $10 I_n$	$\pm 7\% I_g \leq 6 \times I_n$; $\pm 10\% I_g > 6 \times I_n$	$\pm 15\% I_g \leq 6 \times I_n$; $\pm 20\% I_g > 6 \times I_n$
I ($t = k$)	✓	$I_3 = 1.5-2-3-4-5-6-7-8-9-10-11-12-13-14-15 \times I_n$	$\leq 30 \text{ ms}$	$\pm 10\%$	—

For all cases not covered by [Table 141](#), the tolerance values in [Table 142](#) apply.

Table 142 - Tolerance Values

Protection	Trip Threshold	Trip Time
L	$1.05 \leq x I_1 \leq 1.25$	$\pm 20\%$
S	$\pm 10\%$	$\pm 20\%$
I	$\pm 15\%$	$\leq 60 \text{ ms}$
Others	$\pm 20\%$	—

Notes:

1. The minimum value of this trip is 1 s regardless of curve type (self-protection)
2. These tolerances apply under the following conditions:
 - self-powered relay at full power (without start-up)
 - presence of auxiliary power supply
 - two-phase or three-phase power supply
 - preset trip time $\geq 100 \text{ ms}$
3. The value of this trip is ensured between 40 and 500 ms from circuit breaker closing; this setting must be done by the customer
4. Curve accuracy applies from $-20 \text{ }^\circ\text{C}$ to $+55 \text{ }^\circ\text{C}$ ambient. For possible continuous ampere derating for ambient above $40 \text{ }^\circ\text{C}$, consult Rockwell Automation.
5. The right portion of the curve is determined by the interrupting rating of the circuit breaker.
6. Total clearing times shown include the response times of the trip unit, the breaker opening, and the interruption of the current.
7. For high fault current levels an additional fixed instantaneous hardware override is provided at 18 kA.

Time-Current Curves

Figure 80 - 140MG-H Time-Current Curve

- Maximum voltage: 600V AC, 50/60 Hz
- Available Current Sensors: 25 A, 60 A, 100 A

Notes:

1. Curve accuracy applies from -20° C to +55° C ambient. For possible continuous ampere derating for ambient above 40° C, consult Rockwell Automation.
2. Set L function value equal to the motor FLA.
3. Total clearing times shown include the response times of the trip unit, the breaker opening, and the interruption of the current.
4. For high fault current levels an additional fixed instantaneous hardware override is provided at 2.2 kA.

Figure 81 - 140MG-J Time-Current Curve

- Maximum voltage: 600V AC, 50/60 Hz
- Available Current Sensors: 40 A, 60 A, 100 A, 150 A

Notes:

1. Curve accuracy applies from -20° C to +55° C ambient. For possible continuous ampere derating for ambient above 40° C, consult Rockwell Automation.
2. Set L function value equal to the motor FLA.
3. Total clearing times shown include the response times of the trip unit, the breaker opening, and the interruption of the current.
4. For high fault current levels an additional fixed instantaneous hardware override is provided at 3 kA.

Approximate Dimensions

Bulletin 140G/MG G-Frame

Dimensions are in millimeters (inches). Dimensions are not intended to be used for manufacturing purposes.

- ♣ Tightening torque: 18 N·m.
- & Required insulator panel, supplied with extenders.

Figure 182 - Cat. Nos. 140G-N-EXSL13 Top (3-Pole), 140G-N-EXS4 (4-Pole) Rear Spread Terminals (IEC only)

- ‡ Extended spread terminals.
- # Required 200 mm insulating phase barriers provided.
- ♣ Tightening torque: 18 N·m.
- § Terminal for auxiliary contacts.
- & Required insulator panel, supplied with extenders.

Figure 183 - Cat. No. 140G-N-RMB, -RMY Rotary Handle Operating Mechanism

- ★ Rotary handle operating mechanism on molded case circuit breaker.
- ‡ Compartment door interlock.
- § Door escutcheon.
- ◆ Tightening torque: 2.5 N·m.
- ♣ Terminal for customer wiring connection.
- ▽ Reduced flange of rotary handle for door (optional).

Description	A
With escutcheon	125...141
Without escutcheon	147

Figure 184 - Cat. No. 140G-N-TLA43, -TLA44, -TLC43, -TLC44 Terminals

- ★ Terminals for cable connection.
- ‡ Tightening torque: 43 N·m.
- ♣ Tightening torque: 18 N·m.
- ▽ Required insulator panel, supplied with extenders.

Figure 185 - N-Frame Flex Cable Operator and Actuator, Right Hand

Figure 186 - N-Frame Flex Cable Operator and Actuator, Left Hand (requires 140G-BML, sold separately)

Bulletin 140G NS-Frame

Figure 187 - Panel Mounted Molded Case Circuit Breaker

- ★ End Cap terminals for ring or busbar connection.
- ‡ Busbars.
- § Door escutcheon.
- ◆ Tightening torque: 18 N•m.
- ▽ Padlock (optional).
- & Tightening torque: 2.5 N•m.
- △ Terminals for cable connection.

Description	A
With escutcheon	125 ... 184 (4.92 ... 7.24)
Without escutcheon	170 (6.7)

Description	B
Standard	208 (8.19)

No. of Poles	C
3	70 (2.76)
4	140 (5.51)

Figure 188 - Drilling Templates for Molded Case Circuit Breaker Mounting

- S Door escutcheon
- # Compartment door with escutcheon
- ★ Compartment door without escutcheon

Figure 189 - Cat. Nos. 140G-N-TLA63, -TLA64, -TLC63, -TLC64 Terminals

- ★ Terminals for cable connection.
- ‡ Tightening torque: 43 N•m.
- ♣ Tightening torque: 18 N•m.
- ▽ Required insulator panel, supplied terminals.

Figure 190 - Cat. Nos. 140G-N-TLV3, -TLV4, -TLH3, -TLH4 Rear Terminals

- ★ Rear horizontal terminals
- ‡ Rear vertical terminals
- ♣ Tightening torque: 20 N·m

Figure 191 - Drilling template for mounting plate

No. of Poles	B	C
3	70 (2.76)	192.5 (7.58)
4	140 (5.51)	262.5 (10.33)

Figure 192 - Cat. No. 140G-N-EXSLI3, -EXSL03, -EXS4 Extended Front Spreader Terminals (IEC only)

- ★ Extended spread terminals.
- ‡ Tightening torque: 18 N·m.
- \$ Required 200 mm insulating phase barriers provided.
- △ Required insulator panel, supplied with spreaders.

Figure 193 - Cat. Nos. 140G-N-EXT3, -EXT4 Extended Front Terminals (IEC only)

- ‡ Tightening torque: 18 N·m.
- ♣ Required insulator panel, supplied with extended Terminals.
- △ Extended terminals.
- ◆ Required 100 mm insulating phase barriers provided.
- ♣ Terminal for customer wiring connection.
